Subject: Cleanup of lower Willamette River

I strongly prefer option H, which would actually completely clean up our river, but I understand that no government agency is willing to fund something that could truly resolve these dreadful issues of contamination.

So I choose option G as the next best option, however, there are several additional points that must be addressed.

- 1) The following areas of contamination must be removed:
 - a. 571.7 acres of dredging
 - b. 184.7 acres of capping
 - c. 19.5 acres of Enhanced Monitored Recovery
 - d. 1391 acres of Monitored Recovery
- 2) These levels of construction plus monitoring must include additional acres of dredging where toxicity levels, public usage or other factors warrant additional dredging. To protect future generations, a full cleanup is essential.
- 3) Please completely remove the contamination from the river, and DO NOT put it back in a different area of the river. Place it in a proper facility like the Roosevelt Facility or the Wasco Facility.
- 4) Monitor the air and water quality during the cleanup to protect the neighbors, workers and wildlife.
- 5) When completed, we want healthy fish in the 11 miles of the study area so that the fish are entirely edible without an advisory.
- 6) Polluters who caused the contamination, and increased their profits by dumping their contamination into our river should pay for this cleanup. They caused the problem, they should pay for the cleanup!

7) Compel the government representatives and entities to adhere to the requests of the community to protect our citizens and wildlife.

Thank you,
